

1) It should feel obvious without thinking too much: The user shouldn't have to figure anything out. Big visuals, clear actions, search right in front of them. If they want a place, they

get there in like 2 clicks max. No weird flows or hidden stuff.

2) Make it feel alive, not static: Smooth transitions, little animations, things reacting when you

hover or tap. Not over the top, just enough to make it feel responsive and modern. Also images

do most of the talking, not walls of text.

3) Don't break on mobile (seriously): Most people will be on their phones anyway, so it should basically be designed for that first. Easy thumb navigation, fast loading, nothing cramped or annoying.

That's pretty much the core of it. Everything else (colors, layout systems, etc.) just supports these.
